

DIGITAL FORENSIC EXAMINATION REPORT

CASE REF: 2004-CF-0920

EXAMINER: Jacob Blazek

DATE: September 20, 2026

EVIDENCE ITEM: Forensic Disk Image (Segmented EnCase Format: .E01 / .E02)

SOURCE DEVICE: Dell Latitude CPi Notebook (S/N: VLQLW)

HARDWARE ATTACHED: Compaq WL110 PCMCIA 802.11b Card, Directional High-Gain Antenna

1. EXECUTIVE SUMMARY

On September 20, 2004, an abandoned Dell Latitude CPi laptop equipped with an external antenna was recovered following reports of unauthorized Wi-Fi sniffing and network surveillance near local commercial hotspots.

A forensic analysis of the dual-segment image (`4Dell Latitude CPi.E01/.E02`) was conducted to determine ownership, identify installed tooling, and check for evidence of illicit network activity.

Key Findings:

1. Attribution: The operating system is registered to Greg Schardt. Application configuration records confirm Schardt operated the machine under the primary

local user profile and alias "Mr. Evil."

2. Offensive Toolset: The drive contained pre-installed utilities configured for 802.11 wardriving, promiscuous-mode packet sniffing, password extraction, and IP obfuscation.
3. Proof of Execution: Recovered packet capture files located in the suspect's profile directory confirm active interception of unencrypted HTTP traffic from a third-party mobile device on the network.

2. EVIDENCE INTEGRITY & VERIFICATION

Before parsing the file system, cryptographic hash verification was conducted to confirm image integrity and maintain chain of custody:

Container Type: Expert Witness Format (E01 / E02)

Target Partition: NTFS (Partition 2, Sector Offset 63)

Acquisition MD5 Hash: aee4fcd9301c03b3b054623ca261959a

Verification Status: CONFIRMED MATCH (Bit-for-bit integrity verified)

3. HOST PROFILE & SUSPECT ATTRIBUTION

Registry hives and local configuration files were parsed to extract host identifiers and tie the system to the suspect:

Host Name: N-1A9ODN6ZXK4LQ
Operating System: Microsoft Windows XP Professional (Build 2600, SP1)
OS Install Date: August 19, 2004 (22:48:27 GMT)
Registered Owner: Greg Schardt
Primary User Account: Mr. Evil (SID: S-1-5-21-...-1003)
Logon Count (Mr. Evil): 15 Sessions (Dominant user on system)

Linking "Greg Schardt" to the "Mr. Evil" Handle:

Definitive correlation between the legal name and the online handle was uncovered in the initialization file for Look@LAN:
Path: `C:\Program Files\Look@LAN\irunin.ini`

Key configuration entries:

regowner = Greg Schardt
LAN user = Mr. Evil
NIC IP = 192.168.1.111
NIC MAC = 00:10:A4:93:3E:09

This local configuration binds the registered owner name directly to the active LAN username under the same network interface, verifying single-operator control.

4. SOFTWARE AUDIT (OFFENSIVE UTILITIES)

File system inspection identified several specialized utilities installed on the host commonly used in offensive network operations and reconnaissance:

1. Network Stumbler v0.4.0 ('C:\Program Files\NetStumbler\')

- Wireless wardriving tool used to map nearby 802.11 networks, capture SSIDs, and record SNR (signal-to-noise) metrics.

2. Ethereal v0.10.6 ('C:\Program Files\Ethereal\')

- Network protocol analyzer paired with the WinPcap packet driver to capture raw traffic in promiscuous mode.

3. Cain & Abel v2.5 beta45 ('C:\Program Files\Cain\')

- Multifunction recovery and cracking suite used for hash extraction, ARP poisoning, and credential sniffing.

4. 123WASP ('C:\Program Files\123WASP\')

- Password recovery utility used to extract stored system secrets, dial-up credentials, and cached account passwords.

5. Look@LAN v2.50 ('C:\Program Files\Look@LAN\')

- Network discovery scanner used for automated subnet mapping and active host tracking.

6. Anonymizer Bar (`C:\Program Files\Anonymizer\`)

- Browser add-on utilized to route HTTP traffic through external proxies to mask the originating client IP.

5. ARTIFACT ANALYSIS & PROOF OF USE

System artifacts confirm these tools were actively deployed, not merely dormant on the drive:

A. Packet Capture Analysis:

- Examiner located an active capture file named `interception` in the primary user's directory (`C:\Documents and Settings\Mr. Evil\interception`).
- Reconstructed TCP/HTTP stream analysis revealed intercepted cleartext traffic originating from a nearby client device identified as a Windows CE (Pocket PC) v4.20 system.
- Captured records include active web browsing requests to `mobile.msn.com` and unencrypted MSN Hotmail session activity.

B. Access Point Reconnaissance:

- Saved NetStumbler scan logs (`.nsl` files) were recovered, containing logged MAC addresses (BSSIDs), network names (SSIDs), and encryption flags from commercial Wi-Fi access points.

C. Execution Tracking:

- Windows UserAssist registry keys recorded repeated execution counts for `netstumbler.exe`, `ethereal.exe`, and `cain.exe` by user "Mr. Evil" during the weeks preceding system recovery.

6. CONCLUSION

Based on file system analysis, registry parsing, and network artifact recovery:

1. The abandoned Dell notebook was owned, registered to, and operated by Greg Schardt.
2. Schardt maintained administrative control of the system under the alias "Mr. Evil."
3. The hardware configuration (external high-gain antenna) and software profile were arranged specifically for wireless network discovery and packet sniffing.
4. The recovered `interception` file conclusively proves the user successfully captured live, unencrypted data streams from third-party devices on proximate networks.

EXAMINER ATTESTATION

The findings detailed in this report are based on objective analysis of the digital evidence provided, conducted using standard forensic methods and verified tools.
